# 1 CHANGELOG

---

Date	Author	Change	Version
04/07/13	Mario P.	First Version	v1r1

## 2 INTRODUCTION

---

This document describing the email monitoring received from a data filtering.

This plugin perform the following features.

- Monitoring if we get a new mail with filtering that perform (Emitter, Subject, Body text, Date Received...)
- We can capture email information we receive. (numeric data or string)
- You have the option of choosing between different mailbox.
- Support SSL

### 3 REQUIREMENTS

---

The plugin has the requirements to run:

- Have access to our mail server from Pandora server or from other server where you execute the plugin.
- Have Perl installed on your computer.
- Is needed the perl library Mail::Simple and Mail::IMAPClient and for the proper functioning of the plugin.
- In the case of using SSL you should also have the IO::Socket::SSL. These libraries can be installed by default, in the case of not having them can be installed using cpan.

## 4 COMPATIBILITY MATRIX

---

The agent compatibility matrix is the following:

Systems where it has been tested	<ul style="list-style-type: none"> <li>Linux ( SUSE, Ubuntu... )</li> </ul>
Systems where it should work	<ul style="list-style-type: none"> <li>Any system with Perl installed</li> </ul>

## 5 MODULES GENERATED

---

With this plugin you can generate all server modules that you want depending on the filtering setting and all email accounts as needed.
